Sorting into (In)formality: Job Offers and Worker Preferences (*Job Market Paper*) [link]

Informal employment remains widespread in developing economies. Workers may remain informal because formal job offers are scarce or because they prefer the terms of informal work. I distinguish these explanations using labor inspections in Brazil that require employers to register informal workers, creating opportunities to formalize existing jobs. Within six months, new formal hires correspond to 78 percent of informal men and 68 percent of informal women detected by inspectors. Take-up varies across workplaces, with the gender gap reversing between male- and female-dominated industries. To explain this pattern, I develop and estimate a discrete-choice model showing that men and women respond similarly to wage premia but differ in how they value non-wage job attributes. A complementary survey experiment shows that most workers accept formalization when offered, particularly when take-home pay is preserved. Women's lower acceptance is consistent with a more valuable informal alternative, partly reflecting household constraints and preferences for job attributes associated with informal work. Combining inspection-based take-up with observed labor market transitions, I estimate that 38 percent of informal men and 29 percent of informal women have an opportunity to formalize within six months, assuming comparable take-up outside inspections. These results suggest that limited formal job opportunities are the main barrier to formalization, while wages and job attributes shape workers' willingness to accept formal employment.

Labor Market Flexibility and Gender Heterogeneity in Labor Allocation
Revise and Resubmit, **Journal of Development Economics** [link]

Does greater flexibility create job opportunities and improve labor allocation? This paper examines how firms and workers respond to a labor market flexibility shock in a setting characterized by high regulation costs. Focusing on the Brazilian labor market, I leverage linked formal employer-employee data to analyze the impacts of the 2017 Labor Reform, a policy that removed constraints on flexible work schedules. I show that this policy change led to an increase in job opportunities and employment, especially in part-time positions. Notably, women experienced greater employment gains. At the state level, I observe that while the reform did not significantly impact unemployment rates, it contributed to reduce informality, which accounted for 40% of the workforce in 2016. Gender-specific analysis indicates that this effect is primarily driven by women transitioning from informal to formal employment within the private sector in the short run, followed by both women and men in the state-level economy in the medium run. These findings underscore the interaction between labor market flexibility and gender disparities, underscoring the potential of such reforms to reconfigure

employment allocation. The case of the Brazilian reform offers a more nuanced perspective when informality is considered.

Managers and the Cultural Transmission of Gender Norms (with Virginia Minni, Kieu-Trang Nguyen and Heather Sarsons) [link]
NBER Working Paper 34782, 2026.

This paper studies how managers' gender attitudes shape workplace practices and culture. Using data from a multinational firm operating in over 100 countries, we leverage cross-country manager rotations to identify the effects of male managers' gender attitudes on gender pay gaps within teams. Managers from countries with one standard deviation more progressive gender attitudes reduce the pay gap by 5 percentage points (18% of the baseline gap), half of which is driven by women being promoted. These effects are strongest in conservative countries. They persist even after managers rotate out, in part because they influence the practices and attitudes of local managers, including peers who interact with them but are not under the direct purview of foreign managers.
